Final Report

Date: April 1, 2026

Executive Summary

This project analyzes leadership energy sustainability and burnout visibility using survey data from Domain 2: Leadership Energy & Performance Capacity within the Rise 1 Million Global Insights initiative. The objective was to describe how organizations perceive leadership performance sustainability, confidence in maintaining leadership pace, presence of burnout tracking systems, and the extent to which fatigue is linked to strategic errors.

Using descriptive analytics and visualization techniques, we examined four assigned survey questions (Q7, Q8, Q9, and Q11). Results show that most organizations do not formally measure leadership energy sustainability or burnout indicators, with a large concentration of responses indicating uncertainty or lack of tracking. Confidence in leaders maintaining their current performance pace is generally moderate rather than high, suggesting variability in perceived long-term sustainability.

The Power BI dashboard translates these findings into an executive-level visual summary, highlighting key distributions and response patterns. Rather than diagnosing causes or proposing organizational changes, the analysis identifies measurement gaps and notable response patterns that may guide future phases of the global study.

Overall, the findings suggest that leadership performance is widely monitored, but the human energy supporting that performance is rarely measured, creating limited visibility into burnout risk at an organizational level.

Introduction & Business Context

Modern organizations typically evaluate success using productivity, growth, and performance metrics. However, fewer organizations assess whether leaders have the sustainable energy capacity required to maintain performance over time. Increasing attention to burnout and leadership fatigue has created a need for new measurement approaches that focus on human sustainability rather than output alone.

The Rise 1 Million project aims to build the world's first global index of Human Energy Sustainability, helping organizations understand leadership capacity, burnout risk, and long-term performance stability. As part of the foundational research phase, student teams contribute early data exploration and insight development using a pilot dataset.

Our team was assigned Domain 2: Leadership Energy & Performance Capacity, focusing on four specific survey questions:

- Q7. Sustainable energy vs exhaustion fueling performance
- Q8. Confidence in leaders maintaining pace for 12 months
- Q9. Presence of burnout or human energy tracking indicators
- Q11. Percentage of strategic errors linked to leader fatigue

The project scope required descriptive reporting and pattern flagging only. The analysis does not establish causality, evaluate organizational effectiveness, or provide prescriptive recommendations.

To communicate findings clearly to stakeholders, the project integrates three deliverables:

1. A professional analytical report
2. An interactive Power BI dashboard serving as a visual executive summary
3. Supporting documentation outlining methods and ethical considerations

Together, these outputs support the larger Rise 1 Million research effort by identifying early trends and highlighting areas where leadership energy sustainability measurement remains limited.

Methodology

Analytic Approach:

This project used a clear and step by step approach to analyze leadership wellness and burnout using survey data. The dataset included leadership responses about sustainable energy, confidence in leadership endurance, burnout tracking practices, and fatigue related performance issues. The first step was reviewing the data to ensure clarity, completeness, and consistency.

Next, qualitative responses were coded to support meaningful analysis. Leadership confidence and energy tracking responses were mapped to scoring scales based on the analysis framework. Percentage-based responses were standardized so they could be compared across all records.
Four indices were then calculated to summarize leadership wellness at an organizational level. These included the Sustainable Energy Ratio, Leadership Sustainability Confidence Index, Energy Tracking Maturity Index, and Fatigue Impact Rate. The final step focused on identifying overall patterns and trends while acknowledging the limitations of self-reported data.

Choice of Analytic Method:

An **index-based quantitative method** was chosen for this analysis because the dataset comes from structured survey questions. **This method allows opinions and perceptions about leadership wellness and burnout to be converted into numbers that are easy to compare and summarize.**
Leadership wellness is complex and cannot be measured using one question alone. Creating multiple indices helps combine related responses into clear measures, such as energy balance, leadership confidence, and burnout tracking maturity. This makes overall patterns easier to understand.
Simple scoring and descriptive analysis were used instead of advanced statistical models because the data is self-reported and based on perception. This choice keeps the analysis transparent, easy to explain, and appropriate for the type and quality of data available.

Choice of tools

Python
Used for data cleaning, transformation, and analysis. Python was applied to process survey responses, convert qualitative data into numerical scores, and calculate key leadership wellness indices such as energy balance, confidence, and burnout impact.

Microsoft Excel
Used for initial data review and storage. Excel supported basic checks for completeness and structure before analysis and helped organize the survey dataset.

Microsoft Word
Used for documentation and reporting.

Power BI
Used for data visualization and reporting. Power BI dashboards and visual summaries were created to clearly present leadership wellness patterns, risk levels, and key index results to support interpretation and decision-making.

Index-Based Scoring Framework (Analytic tool)
Used to standardize survey responses and convert leadership perceptions into measurable indicators for consistent analysis.

Data limitations:
The dataset contains several limitations based on its structure and responses. Many records include answers such as not sure or not tracked, especially for energy measurement and fatigue impact questions. This reduces the amount of numeric information available for analysis. Only a few respondents provided percentage values, which limits variation in some metrics. The data is also cross-sectional, meaning it captures one moment in time and cannot show trends or changes. In addition, several survey questions rely on categorical responses, which restricts detailed comparison across records and may simplify complex leadership conditions.

Findings & Analysis

Key findings:

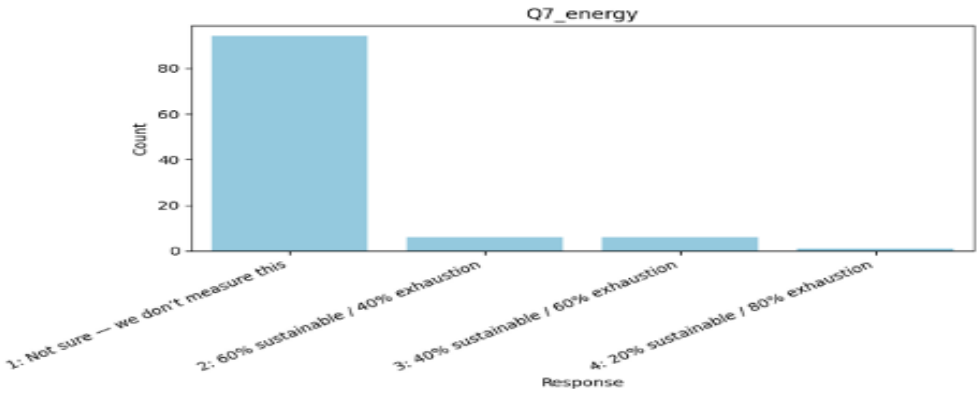
Sustainable Energy Ratio (SER)

Only a small number of respondents provided energy percentages. Among those who did, several reported forty percent sustainable energy and sixty percent exhaustion, placing leadership performance in the burnout risk zone.

```
==================================================
📊 Analysis for: Q7_energy
==================================================

                                    Count  Percentage (%)
Q7_energy
Not sure — we don’t measure this       94           87.85
60% sustainable / 40% exhaustion        6            5.61
40% sustainable / 60% exhaustion        6            5.61
20% sustainable / 80% exhaustion        1            0.93

Mode: ['Not sure — we don’t measure this']
```



Leadership Sustainability Confidence Index (LSCI)

Most leaders selected are somewhat confident or unsure. Fewer selected very confident, and several reported not confident or high concern. This suggests overall leadership confidence is in a watch or risk zone rather than strong.

```
==================================================
📊 Analysis for: Q8_leadership_confidence
==================================================

                                                  Count  Percentage (%)
Q8_leadership_confidence
Somewhat confident                                   48           44.86
Unsure                                               22           20.56
Not confident                                        18           16.82
Very confident                                       15           14.02
Highly concerned — burnout is already present         4            3.74
...
Not tracked           106           99.07
25–50%                  1            0.93

Mode: ['Not tracked']
```

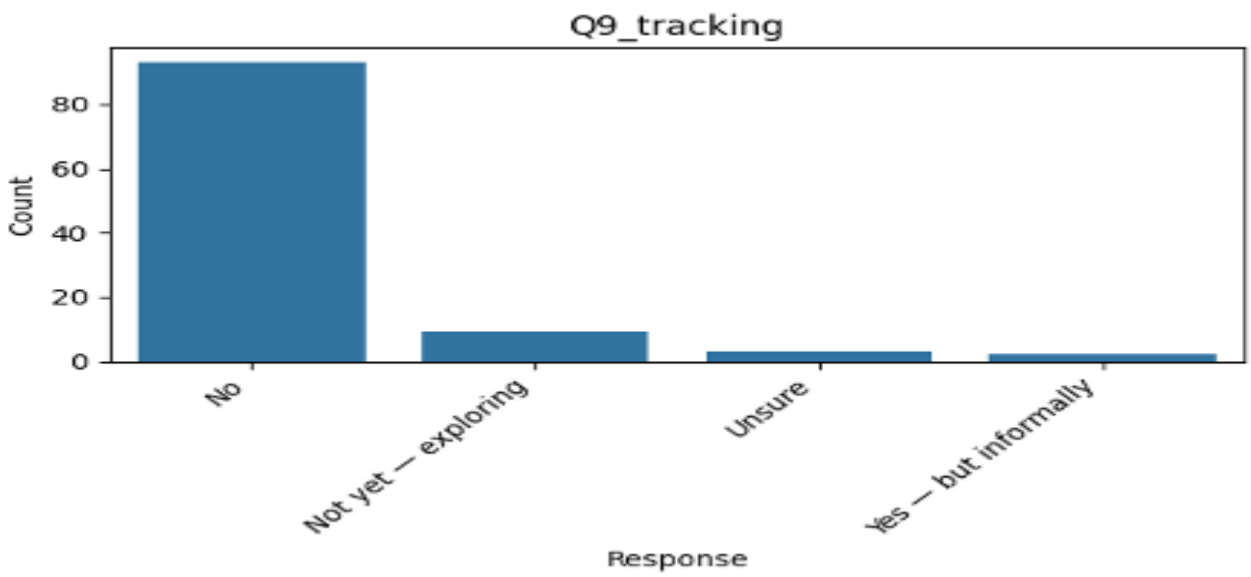
Energy Tracking Maturity Index (ETMI)

The majority of responses indicated no tracking or early exploration of burnout and energy indicators. This places most organizations at a reactive or low maturity level.

```
==================================================
📊 Analysis for: Q9_tracking
==================================================

                        Count  Percentage (%)
Q9_tracking
No                         93           86.92
Not yet — exploring         9            8.41
Unsure                      3            2.80
Yes — but informally        2            1.87

Mode: ['No']
```



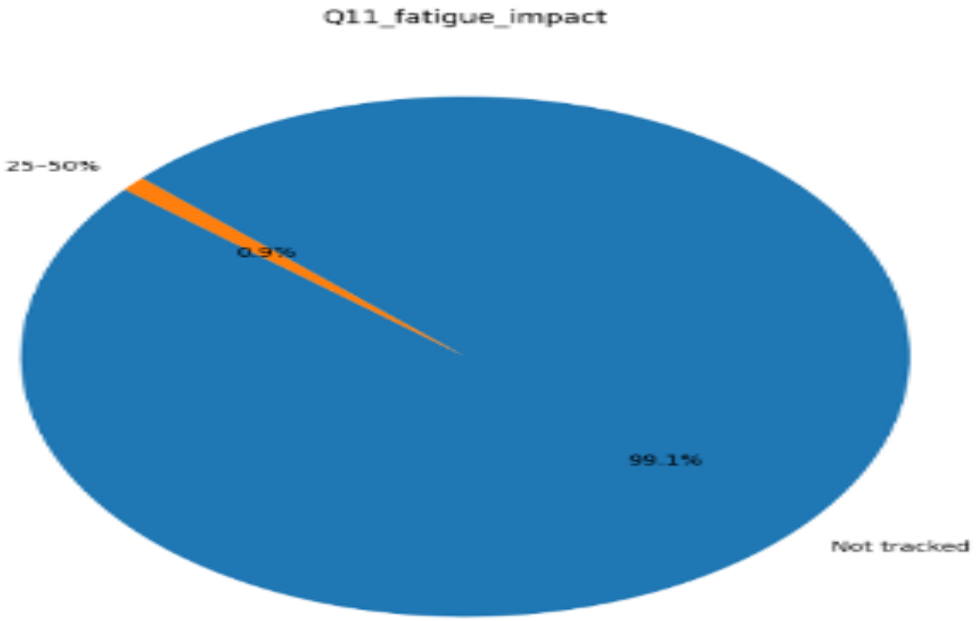
Fatigue Impact Rate (FIR)

Fatigue related errors were mostly not tracked. This limits visibility into how leader exhaustion affects business outcomes and decision making.

```
==================================================
📊 Analysis for: Q11_fatigue_impact
==================================================

                     Count  Percentage (%)
Q11_fatigue_impact
Not tracked            106           99.07
25-50%                   1            0.93

Mode: ['Not tracked']
```



Recommendations and Next Steps

Recommendations

- Based on the answers to questions 7, 9 and 11, the answers show that professionals who took the survey have little to no information about exhaustion, fatigue and what it can cause, which led to the answers dominating the dataset like “Not sure — we don’t measure this” and “Not tracked”. A good recommendation to fix this issue is to have a pre-recorded tutorial to save the companies’ time about the topic and how can you track back that this issue was caused by fatigue or exhaustion, because some people might know the issue and reason but in different wording so we can give them the tutorial beforehand to connect what they know to what we need to know.

- Adjusting the answers to questions to motivate the brain of the survey taker to search for an answer other than “Not sure” or “All of the above”, as it’s proven that the human brain finds it easier to choose these answers once seen, rather than thinking about the actual answers that the person might actually have.

Next Steps

- Compare the results of this survey and findings to an industry-standard survey to benchmark the results and see how we can improve the questions to get better results.

- Applying the same techniques to a larger data dataset, so we can have a better look at how the same analysis can generate different results depending on the dataset.

- Finalizing the final dashboard and presentation with our findings to present to the company and our class.

Appendices

Appendix A – Survey Questions Full Text

- Q7: When you think about your organization's current performance levels, what percentage is fueled by sustainable energy vs exhaustion?
- Q8: How confident are you that your top leaders could maintain their current pace for another 12 months without decline?
- Q9: Do you currently track any indicators of human energy or burnout risk?
- Q11: What percentage of strategic errors or delays last year were caused by leader fatigue or overwhelm?

Appendix B – Complete Frequency Tables

The following tables present clean, formatted versions of the frequency distributions for all four survey questions analyzed in this report (Q7, Q8, Q9, and Q11). Total responses across all questions: n = 107.

Table D1: Q7 – Sustainable Energy vs. Exhaustion Fueling Performance

Response	Count	Percentage (%)
Not sure – we don't measure this	94	87.85
60% sustainable / 40% exhaustion	6	5.61
40% sustainable / 60% exhaustion	6	5.61
20% sustainable / 80% exhaustion	1	0.93
Total	107	100.00

Mode: Not sure – we don't measure this

Table D2: Q8 – Confidence in Leaders Maintaining Pace for 12 Months

Response	Count	Percentage (%)
Somewhat confident	48	44.86
Unsure	22	20.56
Not confident	18	16.82
Very confident	15	14.02
Highly concerned – burnout is already present	4	3.74
Total	107	100.00

Mode: Somewhat confident

Table D3: Q9 – Presence of Burnout or Human Energy Tracking Indicators

Response	Count	Percentage (%)
No	93	86.92
Not yet – exploring	9	8.41
Unsure	3	2.80
Yes – but informally	2	1.87
Total	107	100.00

Mode: No

Table D4: Q11 – Percentage of Strategic Errors Linked to Leader Fatigue

Response	Count	Percentage (%)
Not tracked	106	99.07
25–50%	1	0.93
Total	107	100.00

Mode: Not tracked
